

**Contact Details:** 

Number of horses on yard:

Date:

Vet Details:

- High risk
- Signs of infectious disease
- Confirmed diagnosis
- Isolate immediately

Medium risk

- Been in contact with an infected horse
- Monitor closely and isolate/add to red zone if clinical signs develop
- Monitor rectal temperature twice daily if >38.5C then add horse to red zone

Low risk

- No contact with Red or Amber horses
- Monitor closely and isolate/add to red zone if clinical signs develop

Acting quickly to isolate horses with suspected infectious disease is fundamental in reducing the spread of the disease and controlling the outbreak quickly.

## SIGNS WHICH INDICATE THE NEED TO **ISOLATE INCLUDE:**

• Raised temperature (>38.5C)

• Lethargy/reduced appetite

## **ISOLATION FACILITIES**

- Isolated stable in remote area of yard with a separate airspace to other stables or an isolated field.
- Foot disinfection areas and hand washing facilities should be available
- Use of protective clothing and gloves essential
- Use dedicated and clearly marked equipment, bedding and feed
- Restrict personnel access to essential only. Keep dogs and cats away
- Attend to healthy horses before attending those in isolation
- Horses should not leave isolation until free from disease as confirmed by your vet.
